

## Children's Food Environment State Indicator Report, 2011

The current childhood obesity epidemic is the result of many factors and may not be resolved by any single action. Rather, resolution of the childhood obesity epidemic will require concerted action across many sectors and settings such as child care facilities, communities, and schools. The 2011 Children's Food Environment State Indicator Report highlights selected behaviors, environments, and policies that affect childhood obesity through support of healthy eating. These indicators represent opportunities for action. Specific action steps and resources are detailed in the National Action Guide at <a href="http://www.cdc.gov/obesity/">http://www.cdc.gov/obesity/</a>.

The environments to which children are exposed in their daily lives - schools, child care facilities, and their communities - can influence the healthfulness of their diets. With the high prevalence of childhood obesity in the U.S., supporting healthy food environments is a key strategy to reach the public health goals of reducing childhood obesity and improving nutrition. National and state-specific information is reported in the *Children's Food Environment State Indicator Report* for both behavioral indicators and policy and environmental indicators. Indicators selected for this report had data available for most states. However, individual states may have additional information collected through state-wide surveys and/or policies or regulations enacted outside the monitoring period that can augment the data in this report and thus be used to further inform decision makers. On a state and local level, parents, school and child care staff, health professionals, state officials, and community members play a role in supporting policy and environmental change to ensure children and their families can choose more healthful foods.

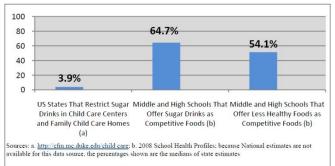

**BEHAVIORAL INDICATORS** -The 2010 Dietary Guidelines for Americans recommends limiting the consumption

of added sugar among Americans.<sup>1</sup> The leading source of added sugar among children is sugar-sweetened drinks (also referred to as sugar drinks).<sup>2</sup> State progress on added-sugar in the diet is measured here by assessing consumption of sugar-sweetened or "regular" sodas among high school students. We also assess the percentage of high school students viewing 3 or more hours of television each day. An objective of *Healthy People 2020* (PA-8) is to increase the proportion of children and adolescents who do not exceed the recommended limit for screen time of no more than 2 hours a day for children 2 years and

The Children's Food Environment State Indicator Report is the 4<sup>th</sup> in a series\* of CDC Reports that highlight environmental and policy indicators to improve nutrition, physical activity and reduce obesity.

older.<sup>3</sup> Data for these indicators are from the 2009 national and state Youth Risk Behavior Surveys, components of CDC's Youth Risk Behavior Surveillance System (students in grades 9-12). Other behavioral indicators reflect recommendations from leading medical associations to not place televisions in children's bedrooms<sup>4</sup> and for children to have meals together with their family.<sup>5</sup> Data on those indicators are derived from the 2007 National Survey of Children's Health.

**POLICY AND ENVIRONMENTAL INDICATORS –** The policy and environmental indicators measure components of food environments across three domains: child care facilities, schools, and the community.

Data in the *Children's Food Environment State Indicator Report* can be used to:

- Monitor progress and celebrate state successes.
- Identify opportunities to improve environmental and policy approaches.

## Children's Food Environment State Indicator Report, 2011

### **Behavioral Indicators**

In this *Children's Food Environment State Indicator Report*, four behavioral indicators are reported.

• Percentage of high school students who drank ≥1 sugar-sweetened soda per day

Sugar drinks are the largest source of added sugar and an important contributor of calories in the diets of children in the United States.<sup>2</sup> Adolescent males consume, on average, around 300 calories from sugar drinks each day.<sup>2</sup> High consumption of sugar drinks, which have few, if any, nutrients, has been associated with obesity.<sup>6</sup>

- Percentage of high school students who watched television ≥3 hours per day
- Percentage of children ages 6-17 with television in their bedroom

Parents can positively impact children's sedentary activity, snacking, and exposure to advertising of unhealthy foods through rules related to TV viewing. One approach that parents can use to encourage healthy lifestyles for children at home is to not put televisions in children's bedrooms. The presence of a television in a child's bedroom has been associated with increased time spent watching television<sup>7</sup> and increased prevalence of obesity.<sup>8</sup> The link to obesity may occur through multiple mechanisms including displacement of physical activity, increased energy intake while viewing, or through greater exposure to television advertising of unhealthy foods which may affect food choices.<sup>9,10</sup> The American Academy of Pediatrics (AAP) recommends that children should not have a television in their bedroom.4

 Percentage of children ages 12-17 who do not eat meals with their families most days of the week

Parents have tremendous influence on children's food behaviors. <sup>11</sup> Eating meals together as a family is associated with positive effects on children across

many domains of life, including the development of healthy eating behaviors<sup>12</sup> and the maintenance of a healthy weight status.<sup>13</sup> Foods prepared and consumed at home may also be more nutritious than foods prepared away from home.<sup>14</sup>

## **Policy and Environmental Indicators**

These indicators represent three different domains or settings for improving the food environment. They correspond with recommendations by groups such as the Institute of Medicine for improvements at the local, community, or school level. States may focus on a few or many of the indicators based on their existing capacity, partnerships, and resources.

## The Child Care Facility Food Environment

According to the Federal Interagency Forum on Child and Family Statistics, 36% of all children younger than six not yet in kindergarten attend child care centers. Additionally, a substantial number of children also attend commercial child care facilities operated in caregivers' homes (family child care homes). However, state regulations regarding nutrition and physical activity are not consistent in their treatment of child care centers and family child care homes. Regulations that ensure both types of facilities maintain healthy food environments could help instill healthy eating habits among a large proportion of America's young children.

- State regulations restrict sugar drinks in child care centers and family child care homes
- State regulations require access to drinking water throughout the day in child care centers and family child care homes

Ensuring the availability of drinking water and limiting access to sugar drinks are ways to improve the food environment of child care facilities. Displacing sugar drinks with drinking water, a calorie-free and thirst-quenching beverage, can

substantially reduce excess energy intake among children. <sup>19</sup> Staff can also teach the importance and healthfulness of drinking water and non-fat/low-fat milk as primary beverages.

 State regulations limit television and video time in child care centers and family child care homes

Young children are highly susceptible to the influence of advertising of unhealthy foods on television.<sup>20</sup> Television and video viewing during child care may also displace recreational time spent engaging in active play and physical activity.

## **The School Food Environment**

The Institute of Medicine recommends that the sale of competitive foods in schools (food sold outside the USDA reimbursable school meal programs such as in vending machines, school stores, snack bars) be limited. Schools are uniquely positioned to facilitate and reinforce healthful eating behaviors by eliminating sugar drinks and high energy density foods (foods high in calories for their volume) from the selection of foods offered on the school campus.

 Percentage of middle and high schools that offer sugar drinks as competitive foods

Although sodas are prohibited in an increasing number of schools, other sugar drinks that may not be commonly perceived as sources of added sugar and excess calories<sup>21</sup> may be available, such as sports drinks and fruit flavored drinks that are not 100% juice. Schools should consider adopting policies that limit access to all sugar drinks in vending machines and schools stores.

 Percentage of middle and high schools that offer less healthy foods as competitive foods

Because human appetite and satiation depend more on the volume of food consumed than on caloric content of the food<sup>22</sup>, reducing the consumption of energy dense, low nutrient foods has been identified as a strategy to prevent weight gain.<sup>23</sup> Foods of

lower energy density and higher nutrient content such as fruits and vegetables in their natural forms, nonfat/low-fat dairy products, and whole grain products are healthful alternatives to high energy density foods such as candy, cakes, salty fried snacks, and ice cream.

 Percentage of middle and high schools that allow advertising of less healthy foods

The Institute of Medicine has concluded that "food advertising to children affects their preferences, purchase behaviors, and consumption habits for different food and beverage categories, as well as for different product brands." In schools, advertising can take the form of posters and signage; logos or brand names on food and beverage coolers, cups, and plates or vending machines; food sales as fundraisers, corporate sponsorship of events; advertising in school publications, and corporate sponsored classroom curricula and scholarships. 24, 25 Such advertising may impact children's ability to make healthy choices in their diets.

## **The Community Food Environment**

Lack of access to retail venues in communities to purchase healthy foods, such as supermarkets, has been associated with a lower quality diet and increased risk of obesity. Likewise, some studies suggest that greater access to convenience stores and fast food restaurants, where healthy choices may not be readily available and may cost more, has been associated with greater likelihood of obesity and lower dietary quality. 26

- Modified Retail Food Environment Index across census tracts within state
- Modified Retail Food Environment Index across impoverished census tracts within state

The modified Retail Food Environment Index (mRFEI) measures the number of healthy and less healthy food retailers in a given area. The mRFEI is

based upon the Retail Food Environment Index, a measurement that has been used previously to assess the food environment and its association with obesity and diabetes, especially in areas of high poverty. 27,28

Lower mRFEI scores for a state indicate either a greater number of census tracts that do not contain any healthy food retailers, a greater number of census tracts that contain many convenience stores and fast food restaurants relative to the number of healthy food retailers, or both.

States can work to identify areas where access to healthy food is limited. Strategies to improve the food environment in these areas can include increased access to places with healthier foods such as supermarkets and produce stores, stands and markets. <sup>29-30</sup> Areas without these types of healthy food retailers may still provide adequate access if smaller stores and fast food restaurants provide quality and affordable healthy foods and beverages.

#### **Data Sources**

#### **Behavioral Indicators**

#### Percentage of high school students who drank ≥1 sugar-sweetened soda per day

Youth Risk Behavior Survey (students in grades 9–12), 2009. Weighted percentage.

The school-based 2009 Youth Risk Behavior Survey included the following question: "During the past 7 days, how many times did you drink a can, bottle, or glass of soda or pop, such as Coke, Pepsi, or Sprite? (Do not include diet soda or diet pop.)" Response categories ranged from "I did not drink soda or pop during the past 7 days" to "4 or more times per day." National estimate is based upon a nationally representative sample of high school students and is not calculated from state estimates. Data were not available for states that did not conduct a 2009 YRBS, did not achieve a high enough overall response rate (≥60%) to receive weighted results, or did not include the soda question on their 2009 YRBS questionnaire.

Available at <a href="http://www.cdc.gov/HealthyYouth/yrbs/index.htm">http://www.cdc.gov/HealthyYouth/yrbs/index.htm</a>

#### Percentage of high school students who watched television ≥3 hours per day

Youth Risk Behavior Survey (students in grades 9–12), 2009. Weighted percentage.

The school-based 2009 Youth Risk Behavior Survey included the following question: "On an average school day, how many hours do you watch TV?" Response categories ranged from "I do not watch TV on an average school day" to "5 or more hours per day". National estimate is based upon a nationally representative sample of high school students and is not calculated from state estimates. Data were not available for states that did not conduct a 2009 YRBS, did not achieve a high enough overall response rate ( $\geq$ 60%) to receive weighted results, or did not include the television question on their 2009 YRBS questionnaire.

Available at http://www.cdc.gov/HealthyYouth/yrbs/index.htm

#### Percentage of children ages 6-17 years with television in bedroom

National Survey of Children's Health, (Middle Childhood and Adolescence (6-17 years)), 2007. Weighted percentage. The National Survey of Children's Health includes 1 question asked to parents (via telephone survey). "Is there a television in [CHILD'S NAME] bedroom?"

Available at: http://nschdata.org/Content/Guide2007.aspx.

#### Percentage of children ages 12-17 who do not eat with family most days of the week

National Survey of Children's Health, (Middle Childhood and Adolescence (6-17 years)), 2007. Weighted percentage.

The National Survey of Children's Health includes 1 question asked to parents (via telephone survey) "During the past week, how many days did all the family members who live in the household eat a meal together?" The percentage presented is based upon the number of parents of children ages 12-17 participating in the study who responded 0, 1, 2, or 3 days.

Available at: <a href="http://nschdata.org/Content/Guide2007.aspx">http://nschdata.org/Content/Guide2007.aspx</a>.

#### Policy and Environmental Indicators

#### State regulations restrict sugar drinks in child care centers and family child care homes

States with specific regulations that apply to both child care centers and family child care homes and restrict sugar drinks. Based upon data from: "Preventing Obesity in the Child Care Setting: Evaluating State Regulations." Regulations current as of: December 2008; Date accessed: July 15, 2010.

Available at http://cfm.mc.duke.edu/child care.

#### State regulations require access to drinking water throughout day in child care centers and family child care homes

States with specific regulations that apply to both child care centers and family child care homes and require drinking water to be available for children throughout the day. Based upon data from: "Preventing Obesity In the Child Care Setting: Evaluating State Regulations." Regulations current as of: December 2008; Date accessed: July 15, 2010.

Available at http://cfm.mc.duke.edu/child care.

#### State regulations limit television and video time in child care centers and family child care homes

States with specific regulations that apply to both child care centers and family child care homes and require that television, video, and/or computer time be limited. Based upon data from: "Preventing Obesity In The Child Care Setting: Evaluating State Regulations." Regulations current as of: December 2008; Date accessed: July 15, 2010.

Available at <a href="http://cfm.mc.duke.edu/child care">http://cfm.mc.duke.edu/child care</a>.

#### Percentage of middle and high schools that offer sugar drinks as competitive foods

School Health Profiles, School Principal Survey, 2008. Weighted percentage.

The School Health Profiles School Principal Survey includes a question regarding specific food items available as competitive foods: "Can students purchase each of the following snack foods or beverages from vending machines or at the school store, canteen, or snack bar?" The percentage presented is based upon the number of schools in each state who responded "Yes" to either response category "Soda pop or fruit drinks that are not 100% juice" or "Sports drinks, such as Gatorade." States with estimates are those with weighted data (≥70% response rate). Because national estimates are not available for the Profiles survey, the data presented in the "U.S. National" row is the median of the state estimates.

Available at http://www.cdc.gov/healthyyouth/profiles/

#### Percentage of middle and high schools that offer less healthy foods as competitive foods

School Health Profiles, School Principal Survey, 2008. Weighted percentage.

The School Health Profiles survey includes a question regarding specific food items available as competitive foods: "Can students purchase each of the following snack foods or beverages from vending machines or at the school store, canteen, or snack bar?" The percentage presented is based upon the number of schools in each state who responded "Yes" to one or more of the following response categories: "Chocolate candy", "Other kinds of candy", "Salty snacks that are not low in fat, such as regular potato chips", "Cookies, crackers, cakes, pastries, or other baked goods that are not low in fat", "Ice cream or frozen yogurt that is not low in fat", or "Water ices or frozen slushes that do not contain juice". States with estimates are those with weighted data (≥70% response rate). Because national estimates are not available for the Profiles survey, the data presented in the "U.S. National" row is the median of the state estimates. Available at http://www.cdc.gov/healthyyouth/profiles/.

#### Percentage of middle and high schools that allow advertising of less healthy foods

School Health Profiles, School Principal Survey, 2008. Weighted percentage.

The School Health Profiles survey includes a question regarding advertising of less healthy foods in schools: "Does this school prohibit advertisements for candy, fast food restaurants, or soft drinks in the following locations?" The percentage presented is based upon the number of schools in each state who responded "No" to one or more of the following response categories: "In the school building," "On school grounds including on the outside of the school building, on playing fields, or other areas of the campus", "On school buses or other vehicles used to transport students", or "In school publications (e.g., newsletters, newspapers, web sites, or other school publications)". States with estimates are those with weighted data (≥70% response rate). Because national estimates are not available for the Profiles survey, the data presented in the "U.S. National" row is the median of the state estimates.

Available at http://www.cdc.gov/healthyyouth/profiles/.

# Modified Retail Food Environment Index across census tracts within state; Modified Retail Food Environment Index across impoverished census tracts within state

The number shown is the median across census tracts within each state. Impoverished census tracts are defined as those with 20% or more individuals below the federal poverty line based upon the 2000 US Census. The data presented in the "U.S. National" row are the medians of state scores.

$$mRFEI = 100 \text{ x}$$
 # Healthy Food Retailers # Less Healthy Food Retailers

Numerator: Number of supermarkets, supercenters, and produce stores within census tracts or ½ mile from the tract boundary. The following stores as defined by North American Industry Classification Codes (NAICS) were included: Supermarkets and larger grocery stores (NAICS 445110; supermarkets further defined as stores with >= 50 annual payroll employees and larger grocery stores defined as stores with 10-49 employees); Fruit and Vegetable Markets (NAICS 445230); Warehouse Clubs (NAICS 452910). Fruit and vegetable markets include establishments that retail produce and includes stands, permanent stands, markets, and permanent markets. Produce is typically from wholesale but can include local. The 2007 North American Industry Classification Codes descriptions are available at <a href="http://www.census.gov/eos/www/naics/">http://www.census.gov/eos/www/naics/</a>. Date accessed July 1, 2009.

Denominator: Number supermarkets, supercenters, produce stores, fast food restaurants, and convenience stores within census tracts or ½ mile from the tract boundary. Supermarkets, supercenters, and produce stores were defined as in the numerator. Fast food stores were defined according to NAICS code 722211(fast food restaurants). Convenience stores were defined according to NAICS code 445120 (convenience stores) or NAICS code 445110 (small groceries) where the number of employees was 3 or fewer.

Data sources: Supermarkets, supercenters, and produce store data is derived from InfoUSA business database, 2009. Fast food retail data is from NavTeq database, 2009. Convenience store data is from Homeland Security Information Program database, 2008.

\*Because national estimates are not available for these variables, the data presented in the "U.S. National" row is the median of the state estimates

Data were not available for states that did not achieve a high enough overall response rate (≥70%) on the 2008 School Health Profiles Survey to receive weighted results
