## LEGEND and calculation directions

**Green** – nutrient (necessary); **Yellow** – benign food additive (acceptable); **Red** – foreign food additive (*no place in the human body*). Basically, the greener DyeDiet diagram, the healthier the product is. Even single red segment signals that the food unsafe. The more red looks the diagram, the more risky and less healthy the product is.

$$\text{DyeDiet Foreign (Food Additive) Impact, } \mathbf{DDFI} = \frac{\text{Sum of all } \textcolor{red}{\text{RED DDRFs}}}{\text{Sum of all } \textcolor{green}{\text{GREEN DDRFs}}}$$

$$\text{DyeDiet Nutritional Factor, } \mathbf{DDNF} = \frac{\text{Sum of all } \textcolor{green}{\text{GREEN DDRFs}}}{\text{Sum of [ all } \textcolor{red}{\text{RED DDRFs}} + \text{ all } \textcolor{yellow}{\text{YELLOW DDRFs}} \text{]}}$$

As soon as you have DDFI and DDNF values calculated you can make your decision about a product.

- The RECOMMENDATION would be to *reject* any product with **DDFI > 0.9** ([exceeding 0.9, high risks](#)) and **DDNF < 0.9** ([below 0.9, low nutritional values](#)).
- The PREFERENCES would be **DDFI = 0 (zero)** when no foreign food additives present in a food (no red marked additives) and *highest possible DDNF*, say in **3 - 6 and higher** unit range, for instance.

Please note that the DyeDiet approach is only good for processed food products containing *at least one food additive* (either red or yellow) and it is *NOT applicable to the whole foods* for which DDNF values

would have been impossible to calculate because the sum of “red” and “yellow” additives in the above DDNF equation turns 0 (zero). Indeed, when you eat whole food there is *no intrinsic toxicity* involved if you follow the “golden rule” of eating in moderation whereas benign (yellow) and especially foreign (red) food additives may pose health problems even if consumed in moderation for an extended time (chronic toxicity).

So good luck with using DyeDiet approach and making *less risky* food choices for you and your children!
